Samantha Donaldson (United Kingdom 1987 -)

Ice Vug in Turquoise III

Ice Vug in Turquoise III is a unique sculpture created by the British artist, Samantha Donaldson.

An ethereal nebulous sculpture with a glacier white exterior and rich turquoise cavernous interior. Taking inspiration from rock formations, geodes and the treasures that can be found deep beneath the surface of the earth, Donaldson creates sublime, stylised representations. Her soft white amorphic forms are enhanced by their contrasting inner splash of colour.

These require intense making from the initial blowing to create the amorphic form, through to the laborious cold work working and cutting, to literally slice a section of the piece away and then polish the revealed surface.

An ongoing collection, Donaldson continues to be influenced by the exploration of the 'vug', which is the internal space within a geode. Her aim is to draw the viewer into the internal movement of each unique piece.

The artist can also create pieces to commission, please contact the gallery for further information.

Artist description:

Samantha Donaldson is a contemporary glass artist specialising in hot and cold glass techniques. Having graduated from De Montfort University in 2009 with a First Class BA Honours Degree in Design Crafts, continuing her time at De Montfort as an artist in residency, Donaldson went on to study her Masters at the Royal College of Art in 2012.

Throughout her studies, initially experimenting with other materials, Donaldson was continually drawn back into the glass workshops, resulting in a deep fascination with glass, the beginning of her artistic exploration and long term commitment to her chosen material.

Having initially developed a body of one-off sculptural free blown glass forms, realising the potential of using glass in an expressive and imaginative way, Donaldson continued to sculpt her glass to create mesmerising pieces, exploiting the hot blown glass to create layers of colours, which are then revealed through to extensive cutting and polishing.

Inspired by the internal structures of naturally occurring geodes, it was during these investigations that Donaldson created a series of work influenced by the exploration of the 'vug', which is the internal space within a geode. A continuous theme to her work, the aim being to draw the viewer into the internal movement of each unique piece.

In her own words:

“Rock collections fascinate me. I am particularly interested in ‘Lapidaries’, the professional craftsmen that became skilled at cutting precious stones to obtain the best optical effect. I am therefore exploring the parallels between this and my work, individual specimens capture the succession of events and hint at the transformation to its present state. Minerals like agate form under intense pressure and heat, I am intrigued by the way that such multi-layered and multi-coloured order forms out of such chaos. An associated interest of mine is ‘Stratigraphy’, the study of rock layers and layering. Deposition of one layer is separated from the next by a clear interval or change in texture, colour, or mineralogy. Layers may merge with one another so that boundaries between them are unclear. As I cut and polish the surface of my specimens, my excitement of enquiring cold work techniques liberate the curious lore of this precious material and bring my forms to life. I thrill to see the freshly exposed interior, reveal the captured fragments of the moment of its formation. I have always been particularly interested by the interactions between humans and objects, how one encounters an unfamiliar object of desire”
